Areas**

Floor Care
Guide

General

Floormaster believe that following simple aftercare will ensure that your newly restored wood floor will stay in good condition and gain longevity from our service

- Regularly clean your floor - dust and dirt from foot traffic can be abrasive and similar to a high powered sander at work
- A doormat at entrances will help to prevent debris build up
- Avoid replacing rugs on your floor for 1 week after treatment
- When vacuuming use a soft bristle head or a simple dust broom
- When mopping your floor use **Treatex Floor Care** or a **PH neutral cleaner**. A Micro dust mop will provide the most effective cleaning
- Avoid using detergents or harsh chemicals as these will damage your floor and dull the finish ie. Fairy liquid, cream cleaners, all purpose cleaners

- Water is your wood floors #1 enemy, it can soak into the wood and cause floorboards to warp and stain, so mop up any spills with a dry cloth as soon as they occur
- Never use a steam cleaner on your wood floor
- Fit all your furniture with protective pads to prevent scratches and scrapes

Advantage of Quality Products

TREATEX HARDWAX OIL penetrates the wood to give a hardwearing finish suitable for Domestic and Commercial floors

Recoat only in future no need to resand

- Resanding removes approx. 2mm of wood from your floor, recoating prolongs the length of time between full sanding. It is essential to recoat before too much damage has been done

- Spot repairs are possible on floors treated with Treatex it is not necessary to resand the whole area

- Drying time approximately 6 hours in ideal conditions. Good ventilation speeds up drying time

- **Treatex** has a curing time 3 to 4 days
